## Docket No.: H0610.0352/P352

## **AMENDMENTS TO THE CLAIMS**

- 1. (Original) Process for the production of synthesis gas from a hydrocarbon feed stock comprising the steps of endothermic and/or adiabatic catalytic steam reforming and autothermal steam reforming in series, wherein the steam reforming is carried out in one or more endothermic stages in series and/or in one or more adiabatic steam reforming stages in series with intermediate heating of feed stock gas leaving the adiabatic reforming stages and wherein carbon monoxide containing gas characterised by having a molar ratio of hydrogen to carbon of less than 4.5 is added prior to at least one of the endothermic or adiabatic steam reforming stages and/or prior to the autothermal steam reforming step.
- 2. (Original) Process of claim 1, comprising the further step of adiabatic pre-reforming the feed stock prior to the endothermic or adiabatic steam reforming.
- 3. (Original) Process of claim 1, wherein the endothermic or adiabatic steam reforming is performed in presence of catalysed hardware.
- 4. (Original) Process of claim 3, wherein the catalysed hardware is in form of a ceramic monolith or a cross-corrugated ceramic structure.
- 5. (Original) Process of claim 1, wherein the endothermic steam reforming step is performed in heat conducting relationship with a hot process gas.

Docket No.: H0610.0352/P352

- 6. (Original) Process of claim 5, wherein the hot process gas is an effluent stream from the autothermal reforming.
- 7. (Currently Amended) Process of claim 1, wherein the intermediate heating of the reacting feed stock is performed in heat conducting relation ship relationship with a hot process gas.
- 8. (Original) Process of claim 7, wherein the hot process gas is an effluent stream from the autothermal reforming.
- 9. (Original) Process according to claim 1, wherein the carbon monoxide containing gas comprises tail gas from a Fischer-Tropsch process.
  - 10. (Canceled).
